

Thank you to all Law Enforcement and Security Staff who participated in the Crisis Intervention Training at Greenville Technical College. Special thank you to all civil servants who help protect us, our community, and our nation. We appreciate your daily sacrifice!

For our military who are returning with internal and external wounds, there are no words to express the gratitude that we feel for your service.

What is Posttraumatic Stress Disorder (PTSD)?

Posttraumatic Stress Disorder (PTSD) is an anxiety disorder that can occur after you have been through a traumatic event. A traumatic event is something horrible and scary that you see or that happens to you. During this type of event, you think that your life or others' lives are in danger. You may feel afraid or feel that you have no control over what is happening.

Anyone who has gone through a life-threatening event can develop PTSD. These events can include: Combat or military exposure, Child sexual or physical abuse, terrorist attacks, Sexual or physical assault, Serious accidents, such as a car wreck, and/or Natural disasters, such as a fire, tornado, hurricane, flood, or earthquake.

After the event, you may feel scared, confused, or angry. If these feelings don't go away or they get worse, you may have PTSD. These symptoms may disrupt your life, making it hard to continue with your daily activities.

How does PTSD develop?

All people with PTSD have lived through a traumatic event that caused them to fear for their lives, see horrible things, and feel helpless. Strong emotions caused by the event create changes in the brain that may result in PTSD.

Most people who go through a traumatic event have some symptoms at the beginning. Yet only some will develop PTSD. It isn't clear why some people develop PTSD and others don't. How likely you are to get PTSD depends on many things. These include:

- How intense the trauma was or how long it lasted
- If you lost someone you were close to or were hurt
- How close you were to the event
- How strong your reaction was
- How much you felt in control of events
- How much help and support you got after the event

Many people who develop PTSD get better at some time. But about 1 out of 3 people with PTSD may continue to have some symptoms. Even if you continue to have symptoms, treatment can help you cope. Your symptoms don't have to interfere with your everyday activities, work, and relationships.

What are the symptoms of PTSD?

Symptoms of posttraumatic stress disorder (PTSD) can be terrifying. They may disrupt your life and make it hard to continue with your daily activities. It may be hard just to get through the day.

PTSD symptoms usually start soon after the traumatic event, but they may not happen until months or years later. They also may come and go over many years. If the symptoms last longer than 4 weeks, cause you great distress, or interfere with your work or home life, you probably have PTSD.

There are four types of symptoms: reliving the event, avoidance, numbing, and feeling keyed up.

Reliving the event (also called re-experiencing symptoms):

Bad memories of the traumatic event can come back at any time. You may feel the same fear and horror you did when the event took place. You may have nightmares. You even may feel like you're going through the event again. This is called a flashback. Sometimes there is a trigger: a sound or sight that causes you to relive the event.

Avoiding situations that remind you of the event:

You may try to avoid situations or people that trigger memories of the traumatic event. You may even avoid talking or thinking about the event.

Feeling numb:

You may find it hard to express your feelings. This is another way to avoid memories.

- You may not have positive or loving feelings toward other people and may stay away from relationships
- You may not be interested in activities you used to enjoy
- You may forget about parts of the traumatic event or not be able to talk about them.

Feeling keyed up (also called hyper-arousal):

You may be jittery, or always alert and on the lookout for danger. This is known as hyper-arousal. It can cause you to: Suddenly become angry or irritable, Have a hard time sleeping, Have trouble concentrating, Fear for your safety and always feel on guard, be very startled when someone surprises you

What are other common problems?

People with PTSD may also have other problems. These include: Drinking or drug problems, Feelings of hopelessness, shame, or despair, Employment problems, Relationships problems including divorce and violence, Physical symptoms

What treatments are available?

When you have PTSD, dealing with the past can be hard. Instead of telling others how you feel, you may keep your feelings bottled up. **But treatment can help you get better.**

There are good treatments available for PTSD. Cognitive-behavioral therapy (CBT) is one type of counseling. It appears to be the most effective type of counseling for PTSD. There are different types of cognitive behavioral therapies such as cognitive therapy and exposure therapy. A similar kind of therapy called EMDR, or eye movement desensitization and reprocessing, is also used for PTSD. Medications can be effective too. A type of drug known as a selective serotonin reuptake inhibitor (SSRI), which is also used for depression, is effective for PTSD.
